

MOONBLAST

Empower Your Tokens Unleash Your Potential

DeFi Launchpad Innovation with Fractionalized Vesting!

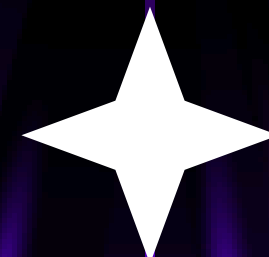

The Mission

Our mission is to provide presale investors an opportunity to liquidate their vested tokens by introducing fractionalised vesting contracts.

Problem Overview

★ Illiquid Investments

Due to long lock-ups and vesting schedules, investors usually must wait a long time for their investment to be liquid.

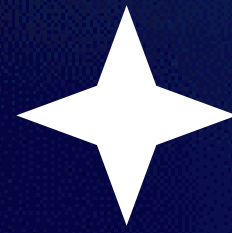

Multiplied presale token price on unvesting

The price disparity between the token's presale price and its value upon unvesting is often significant, resulting in a substantial liquidity demand to the project during unvesting dates.

Loss of potential users

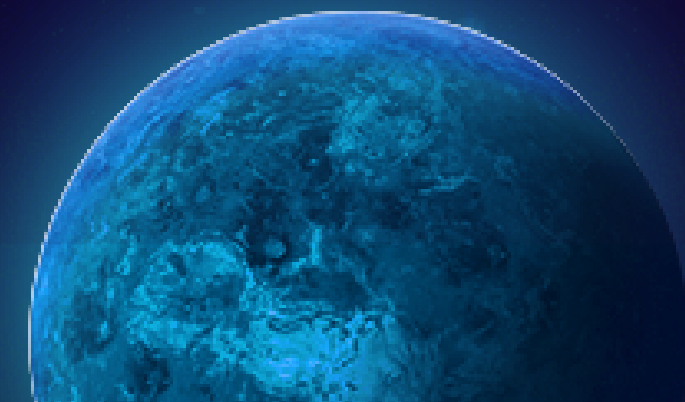

Potential users may be overlooked as they speculate on the token's performance on the secondary market, waiting for a more favorable price to engage.

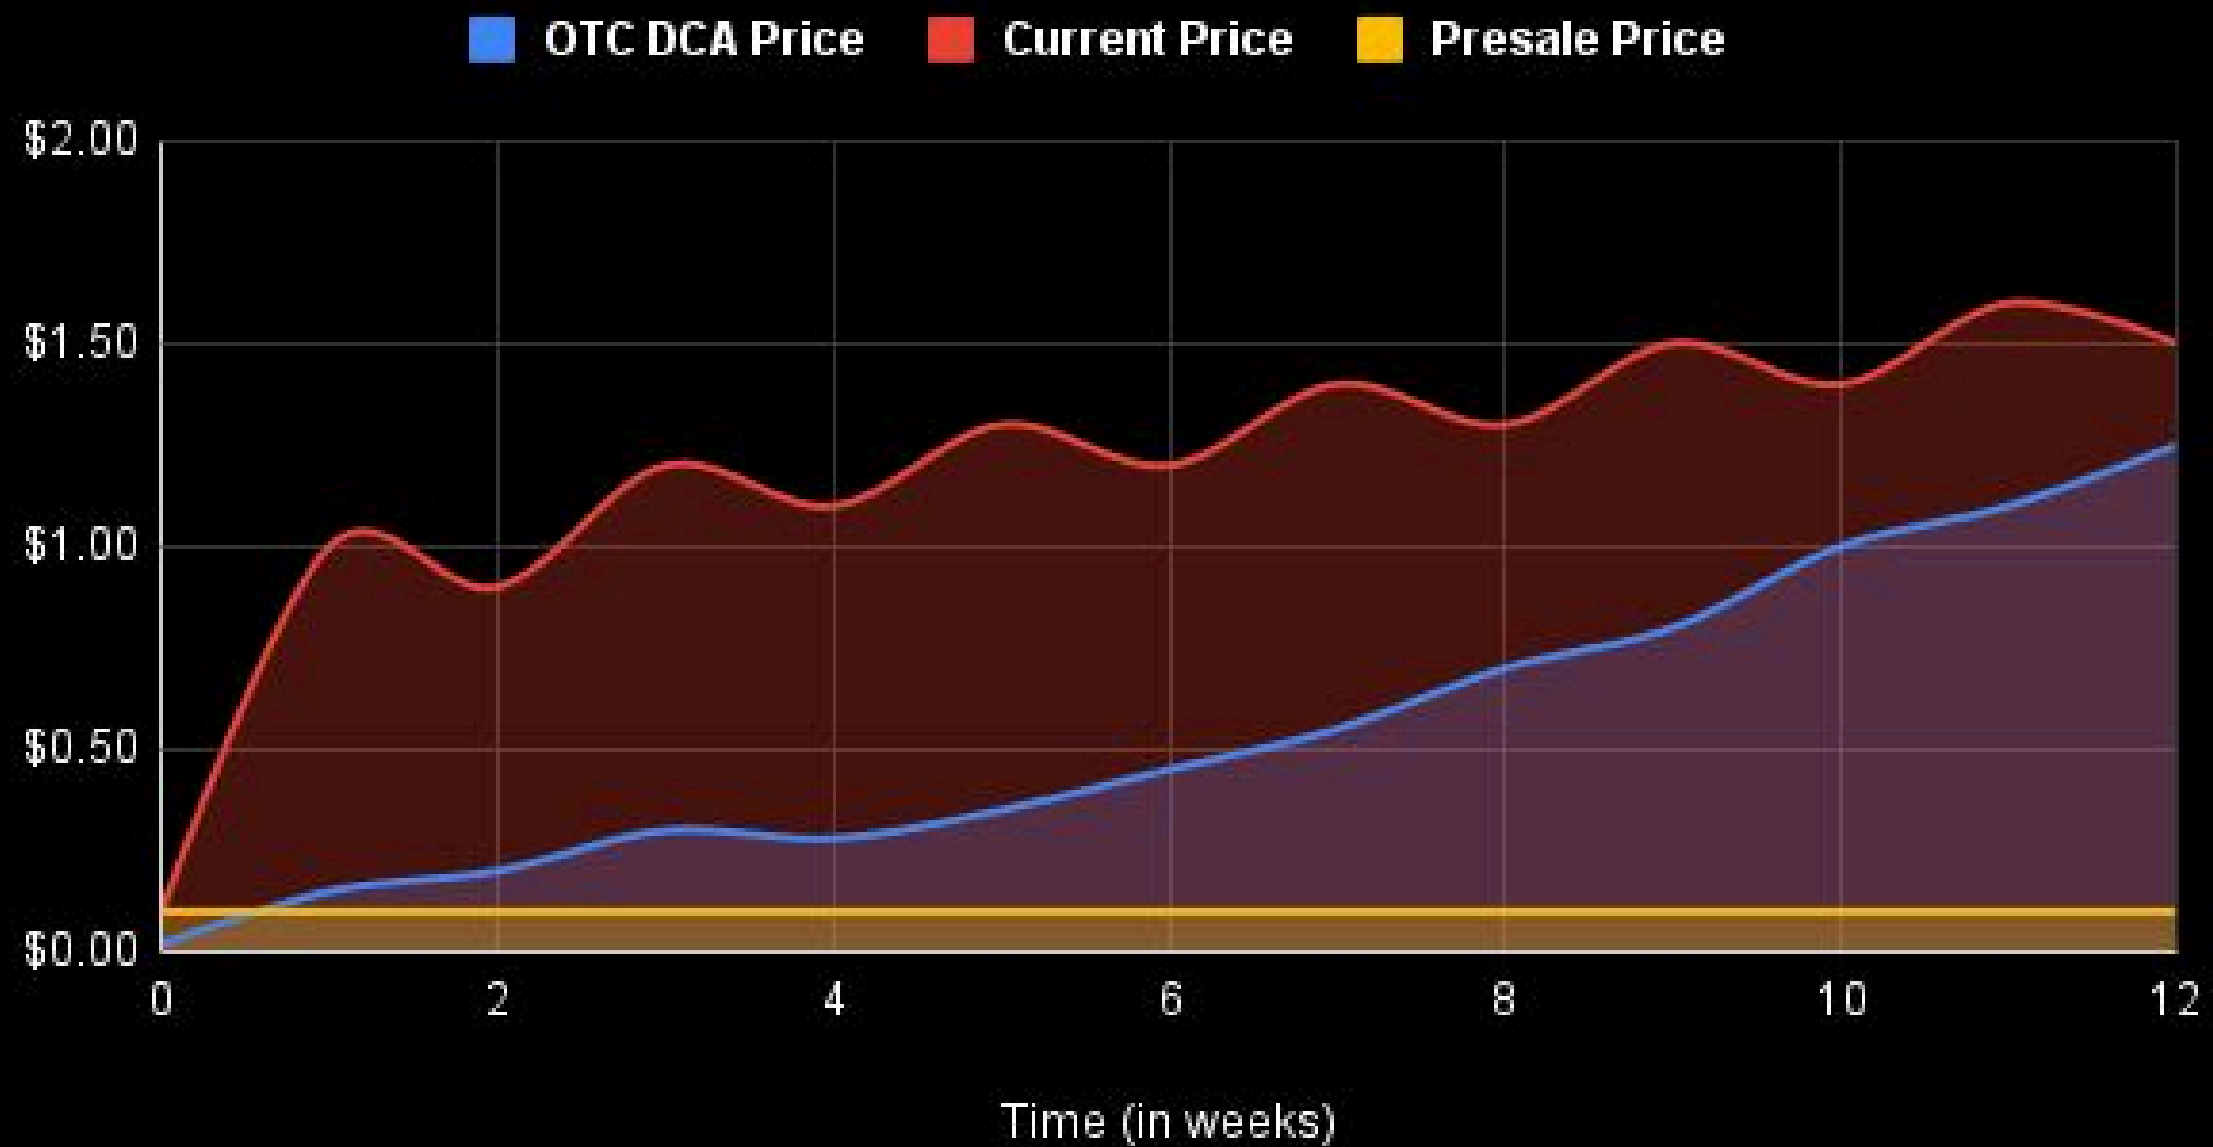

The Solution

MoonBlast introduces Fractionalized Vesting contracts and vNFTs as a tool to transfer ownership of vested tokens.

This enables insiders to sell without speculating on public market volatility and allows new buyers to acquire vested tokens at likely discounted prices.

Example of increased presale token DCA to unvesting

MoonBlastFolio (Vesting Portal) allows presale investors to fractionalize their vesting contracts and allows to resell the presale tokens by OTC deals, which results in a higher DCA acquisition price of the presale tokens and therefore significant less liquidity requirement for the market maker on unvesting.
